## Program Structures & Algorithms

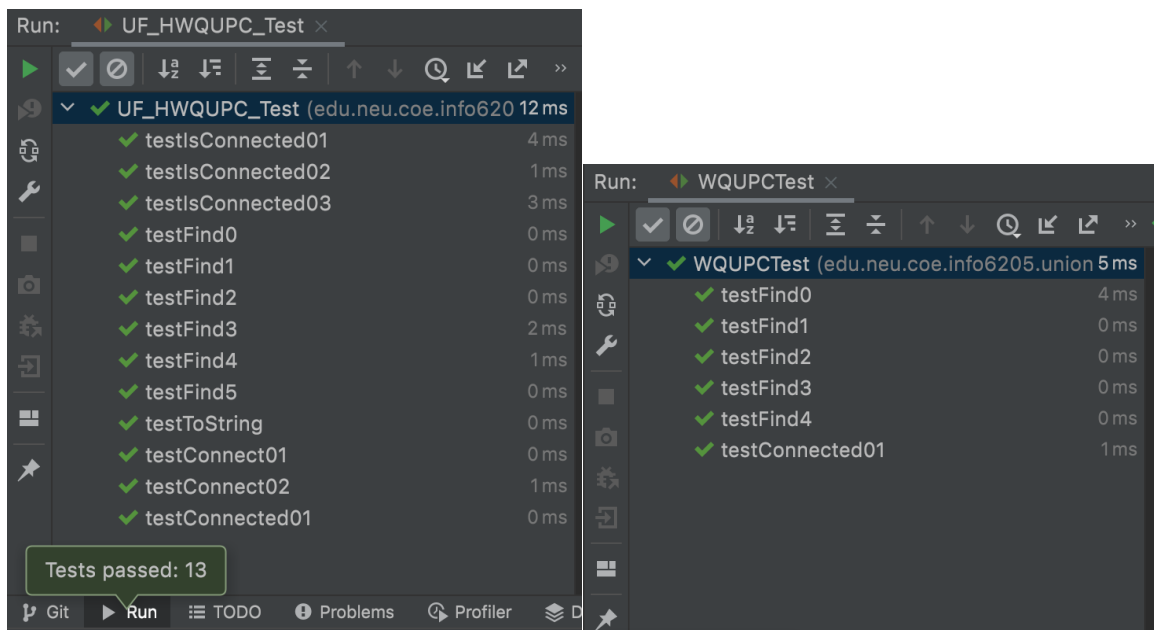

Fall 2021

### Assignment No. 3

#### Task

##### Benchmark

- Step 1:
  - (a) Implement height-weighted Quick Union with Path Compression. For this, you will flesh out the class UF\_HWQUPC. All you have to do is to fill in the sections marked with `// TO BE IMPLEMENTED ... // ...END IMPLEMENTATION`.
  - (b) Check that the unit tests for this class all work. You must show "green" test results in your submission (screenshot is OK).
- Screen shot of unit test:

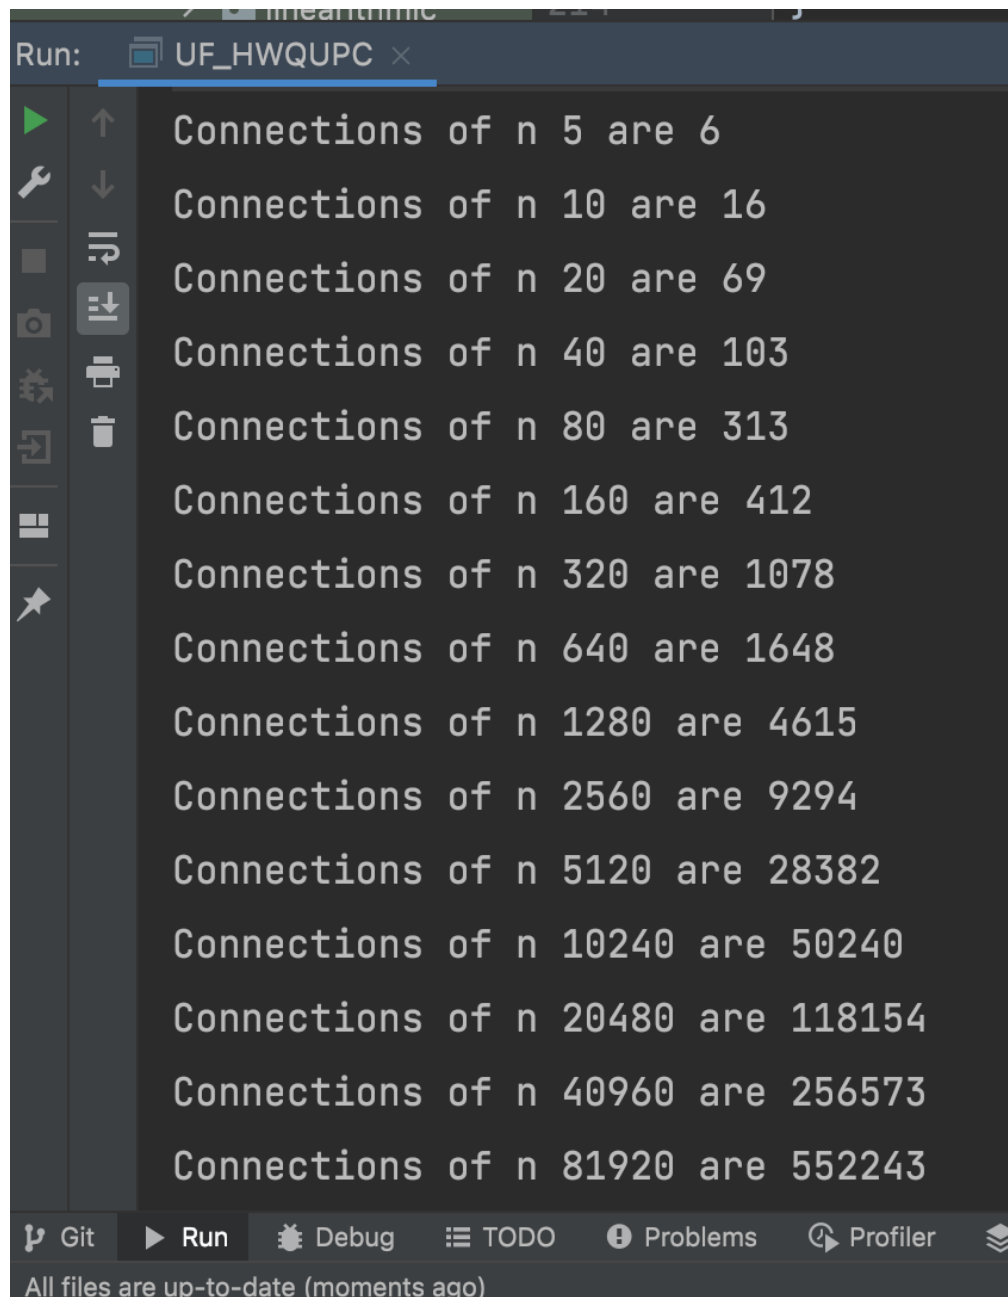

- Step 2:
  - Using your implementation of UF\_HWQUPC, develop a UF ("union-find") client that takes an integer value  $n$  from the command line to determine the number of "sites." Then

generates random pairs of integers between 0 and  $n-1$ , calling `connected()` to determine if they are connected and `union()` if not. Loop until all sites are connected then print the number of connections generated. Package your program as a static method `count()` that takes  $n$  as the argument and returns the number of connections; and a `main()` that takes  $n$  from the command line, calls `count()` and prints the returned value. If you prefer, you can create a main program that doesn't require any input and runs the experiment for a fixed set of  $n$  values. Show evidence of your run(s).

Screen shot of evidence:

Each  $n$  is run for 20 times and get the average of the value.

The screenshot shows an IDE console window with the title bar 'Run: UF\_HWQUPC x'. The console output displays the number of connections for various values of  $n$ . The output is as follows:

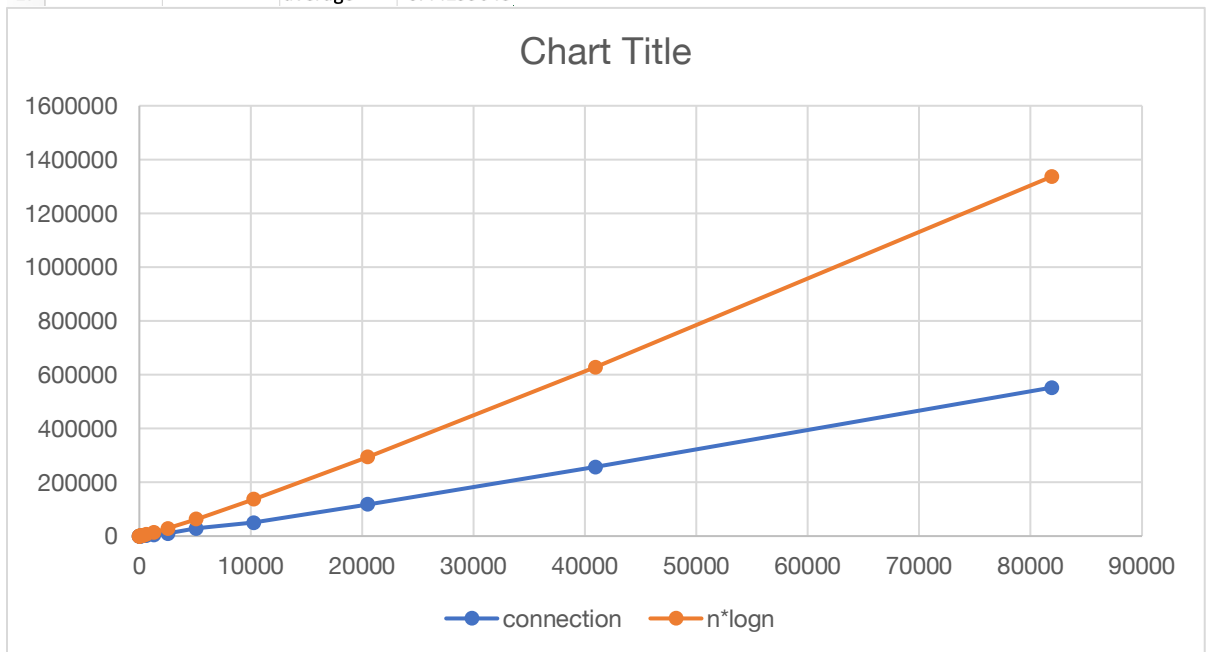

```
Connections of n 5 are 6
Connections of n 10 are 16
Connections of n 20 are 69
Connections of n 40 are 103
Connections of n 80 are 313
Connections of n 160 are 412
Connections of n 320 are 1078
Connections of n 640 are 1648
Connections of n 1280 are 4615
Connections of n 2560 are 9294
Connections of n 5120 are 28382
Connections of n 10240 are 50240
Connections of n 20480 are 118154
Connections of n 40960 are 256573
Connections of n 81920 are 552243
```

The IDE interface includes a sidebar with icons for Run, Debug, and other tools. At the bottom, there is a status bar with tabs for Git, Run, Debug, TODO, Problems, and Profiler, and a message: 'All files are up-to-date (moments ago)'.

Step 3:

Determine the relationship between the number of objects ( $n$ ) and the number of pairs ( $m$ ) generated to accomplish this (i.e. to reduce the number of components from  $n$  to 1). Justify your conclusion in terms of your observations and what you think might be going on.

	A	B	C	D
1	n	connection	$n \cdot \log n$	ratio
2	5	6	11.6096405	0.51681187
3	10	16	33.2192809	0.48164799
4	20	69	86.4385619	0.79825484
5	40	103	212.877124	0.4838472
6	80	313	505.754248	0.61887765
7	160	412	1171.5085	0.35168332
8	320	1078	2663.01699	0.40480403
9	640	1648	5966.03398	0.27623041
10	1280	4615	13212.068	0.34930187
11	2560	9294	28984.1359	0.32065817
12	5120	28382	63088.2718	0.44987759
13	10240	50240	136416.544	0.36828378
14	20480	118154	293313.087	0.40282553
15	40960	256573	627586.175	0.40882513
16	81920	552243	1337092.35	0.41301784
17			average	0.44299648

In that case, the relationship between the sites and connections is :  $f(n) = 0.442 * n * \log_2 n$ .
